NEWS	1		Web Page for STN Seminar Schedule - N. America
NEWS	2	JUL 28	CA/CAplus patent coverage enhanced
NEWS	3	JUL 28	EPFULL enhanced with additional legal status information from the epoline Register
NEWS	4	JUL 28	IFICDB, IFIPAT, and IFIUDB reloaded with enhancements
NEWS	5	JUL 28	STN Viewer performance improved
NEWS	6	AUG 01	INPADOCDB and INPAFAMDB coverage enhanced
NEWS	7	AUG 13	CA/CAplus enhanced with printed Chemical Abstracts page images from 1967-1998
NEWS	8	AUG 15	CAOLD to be discontinued on December 31, 2008
NEWS	9	AUG 15	CAplus currency for Korean patents enhanced
NEWS	10	AUG 27	CAS definition of basic patents expanded to ensure comprehensive access to substance and sequence information
NEWS	11	SEP 18	Support for STN Express, Versions 6.01 and earlier, to be discontinued
NEWS	12	SEP 25	CA/CAplus current-awareness alert options enhanced to accommodate supplemental CAS indexing of exemplified prophetic substances
NEWS	13	SEP 26	WPIDS, WPINDEX, and WPIX coverage of Chinese and and Korean patents enhanced
NEWS	14	SEP 29	IFICLS enhanced with new super search field
NEWS	15	SEP 29	EMBASE and EMBAL enhanced with new search and display fields
NEWS	16	SEP 30	CAS patent coverage enhanced to include exemplified prophetic substances identified in new Japanese-language patents
NEWS	17	OCT 07	EPFULL enhanced with full implementation of EPC2000
NEWS	18	OCT 07	Multiple databases enhanced for more flexible patent number searching
NEWS	19	OCT 22	Current-awareness alert (SDI) setup and editing enhanced
NEWS	20	OCT 22	WPIDS, WPINDEX, and WPIX enhanced with Canadian PCT Applications
NEWS	21	OCT 24	CHEMLIST enhanced with intermediate list of pre-registered REACH substances

NEWS EXPRESS JUNE 27 08 CURRENT WINDOWS VERSION IS V8.3,
AND CURRENT DISCOVER FILE IS DATED 23 JUNE 2008.

AB Electrode-active materials, especially for alkali ion insertion (i.e., Na+ and Li+) for lithium batteries, contain, as an active component, a composition of general formula AaDdMmZsOoNnFf,, in which: (1) A is an alkali metal, (2) D is an alkaline earth metal or a Group IIIA element, with the exception of B, (3) M is a transition metal, (4) Z is a non-metal selected from S, Se, P, As, Si, Ge, Sn, and B, (5) O is oxygen, N is nitrogen, and F is fluorine, and (6) a, d, m, z, o, n, and f are ≥0. The compns., which also contain an electron conductor, such as carbon, are prepared by thermal decomposition of homogeneously mixed precursors, which are organic or organometallic derivs. (preferably at 200-600°). Preferred components include: (1) A = Li, Na, and K, (2) D is Mg, Al, and Ga, (3) M = Fe, Ni, Co, Mn, V, Mo, Nb, W, and Ti; preferred components are $LiFePO_4$, $LiFeBO_3$, or $NaFeBO_3$.

ST electrode mixed oxide lithium rechargeable battery; iron lithium borate secondary battery electrode

IT Transition metal oxides
RL: DEV (Device component use); TEM (Technical or engineered material use); USES (Uses)
(alkaline earth oxides, electrode active materials; composite mixed oxides as active battery electrodes, especially for rechargeable lithium batteries)

IT Transition metal oxides
RL: DEV (Device component use); TEM (Technical or engineered material use); USES (Uses)
(alkali metal oxides, electrode active materials; composite mixed oxides as active battery electrodes, especially for rechargeable lithium batteries)

IT Battery electrodes
(composite mixed oxides as active battery electrodes, especially for rechargeable lithium batteries)

IT Carboxylic acids, processes
RL: CPS (Chemical process); PEP (Physical, engineering or chemical process); PROC (Process)
(dicarboxylic, metal salts and complexes, electrode precursors; thermal decomposition of; composite mixed oxides as active battery electrodes, especially
for rechargeable lithium batteries)

AB   The title lithium ferrous phosphate material has olivine structure, average
     grain size of 1-8 μm, apparent d. ≥ 0.5 g/cm3, tap d. of 1.0-1.4
     g/cm3, sp. surface area ≤ 25 m2/g, and initial specific discharge
     capacity (1C) ≥ 130 mAh/g.  The title method comprises dispersing
     Fe source, P source, Li source, doping element compound, and carbon source
     in dispersant, ball-milling for 1-12 h, drying under nonoxidative atmospheric
at
     250-550° for 2-20 h, grinding, heating under reductive atmospheric at
     15-40°/min, calcining at 500-900° for 3-15 h, and cooling at
     15-40°/min to <40°.  The mol. ratio of Fe source, P source,
     Li source and doping element is (0.7-1):1:(0.98-1.06):(0.02-0.3).  The
     product has small particle size, narrow particle size distribution, high
     purity, and good electrochem. performance.

AB The active mass have olivine-type lithium iron phosphate primary particles and carbon-containing secondary particles, and the secondary particles have approx. spindle-, rhombus- or oval shape. The active mass is manufactured by a process including steps of (1) mixing lithium iron phosphate feedstock, carbonaceous materials, and C2-4 compds. bearing 2-3 hydroxy groups, and (2) heat treatment of the mixts. by hydrothermal crystallization, glycothermal process, or combination of two processes. Secondary Li batteries employing the cathode active mass are capable of high-speed charging and discharging and show high discharge capacity.

ST battery cathode lithium iron phosphate composite carbon; hydrothermal crystn lithium iron phosphate composite battery cathode; glycothermal process lithium iron phosphate composite battery cathode

IT Carbon black, uses
RL: TEM (Technical or engineered material use); USES (Uses)
(acetylene black, ketjen black, composites with lithium iron phosphates, cathode active mass; manufacture of lithium iron phosphate-carbon composite granules as secondary Li battery cathodes)

IT Nanotubes

	IPCR	H01M0004-04 [I,C]; H01M0004-04 [I,A]

AB This method entails: (a) preparing a solution of a Li compound, Fe compound, P compound and reductant at a molar ratio of 1:(0.8-1.2):(0.8-1.2):(0.3-1.0), adding Fe compound and Li compound to reductant, then adding P compound, mixing evenly under stirring, and aging, (b) drying under nonoxidative atmospheric to obtain dry gel, and grinding to obtain precursor, and (c) adding C compound 1.5-11.5% to the precursor, grinding, adding to a crucible, and microwave heating under nonoxidative atmospheric to obtain the final product. The method uses Cr3+ and Co3+ to modify LiFePO4/C. The method has the advantages of a decreased treatment time, enhanced yield, reduced cost and energy consumption and simplified process. The cathode material has the advantages of enhanced conductivity of LiFePO4 and enhanced charge-discharge capacity and cycling ability.

AB A sol-gel method was used to prepare LiFePO4/C composites by using ferric iron as iron precursor. Effects of reductive conditions including the amts. of organic additive of citric acid and the H2 content in the sintering atmospheric of N2 on the microstructural characteristics and electrochem. properties of LiFePO4/C are studied. The LiFePO4/C sample prepared with citric acid and cations in a ratio of 1:2 under sintering atmospheric of 10% H2 + N2 shows a highest discharge capacity of 135 mAh/g at the rate of 0.1 C (1 C = 170 mA/g). A carbon content of .apprx.4% provides a satisfactory discharge capacity of LiFePO4. Citric acid can act as a reducing reagent; hydrogen at 10-20 volume% in the sintering atmospheric can also reduce Fe3+ to Fe2+ completely and a further suitable amount of electro-conductive Fe2P phase could possibly form. Iron phosphides play an important role in the improvement of the high rate capacity of LiFePO4/C and the reaction kinetics of lithium ion. At discharge rates >1 C, suitably increasing the amount of Fe2P to a range of 6-11% in the LiFePO4/C composite favors the rate performance of LiFePO4/C.

AB The materials are manufactured by treatment of aqueous solns. containing Fe compds. and conductive materials (e.g. carbon powder) with oxalic acid, and firing of the resulting Fe(II) oxalate with Li compds. and phosphoric acids. The materials and batteries show high utilization efficiency of iron lithium phosphate.

AB LiFePO4/C composite cathode material was prepared by pelleting and subsequent pyrolytic cracking process in N2 atmosphere with C source of polyvinyl alc. (PVA). XRD crystal anal. indicates that single LiFePO4 phase and amorphous C can be found in the products. SEM observation shows a special micro-morphol. of sample, which is favorable for enhancement of electrochem. properties. The discharge capacity of the LiFePO4/C composite was 135 mAh/g, close to the charge capacity of 153 mAh/g at low rate of 0.1 C. At 0.2 C, the specific capacity was .apprx.117.4 mAh/g, which is satisfied for power source of Elec. Vehicle for its flat discharge platform.

AB A cathode material having olivine or NASICON structures and includes micrometer-sized secondary particles having a particle size of 1-50 μm. Each of the micrometer-sized secondary particles is composed of crystalline nanometer-sized primary particles of a metal compound having a particle size of 10-500 nm. The metal compound has a formula A3xM2y(PO4)3 with A being a Group IA, IIA, or IIIA element, M being a 2nd metal element from Groups IIA, IIIA, or a transition element, and 0<x≤1.2, and 0<y≤1.6. Carbon particles adhere to the surface of the crystalline nanometer-sized primary particles. The cathode material has a

BET sp. surface area of 5-100 m2/g. The cathode material is coated on an electrode plate. The cathode material contains a binder, such as styrene-butadiene rubber or polyvinylidene fluoride. The cathode material contains a thickener, especially CM-cellulose.

AB Carbon coated lithium iron phosphate is produced by ball milling a Li salt, a ferrous salt, a phosphate, and organic carbon source at a molar ratio of Li:Fe:P:C = 1:1:1:(0.2-2) in ethanol or acetone as a dispersant for 3-6 h, drying, tabletting, placing into alumina pot containing activated carbon, and heating under microwave irradiation for 5-12 min. The Li salt can be lithium carbonate, lithium hydroxide, lithium acetate, lithium lactate, lithium oxalate, lithium citrate, or lithium formate. The ferrous salt can be ferrous oxalate, ferrous acetate, or ferrous lactate. The phosphate can be diammonium hydrogen phosphate or ammonium dihydrogen phosphate. The organic carbon source can be citric acid, oxalic acid, tartaric acid, glucose, sucrose, lactose, or maltose. The composite material can be used to fabricate cathodes for lithium batteries.

AB The title process comprises: (1) mixing P compound, Li salt with Fe salt by a mol. ratio of 1-1.1:1-1.1:1-1.1 under the addition of compds. of doping elements or carbon organic compds. (conductive additive); (2) adding organic acid as support; (3) allowing reaction at ≤ 100 °C to obtain nanometer precursor under regulating pH to 4.0-9.0 with LiOH and ammonia liquor; and (4) calcining at 600-800 °C for 5-300 min to give the title product. The Li salt is LiOH, Li2CO3, lithium oxalate, lithium fluoride, lithium phosphate and/or lithium acetate. The Fe salt is soluble Fe salt, ferrous acetate and/or ferrous sulfate. The P compound is NH4H2PO4 and/or (NH4)2HPO4. The doping compound is magnesium acetate and/or magnesium hydroxide. The organic acid is oxalic acid, tartaric acid, acrylic

acid, citric acid, polyacrylic acid, humic acid, polyvinylpyrrolidone, 2-ethylhexoic acid, and/or succinic acid. The carbon-containing organic additive is polypropylene, polyacrylamide, glucose, sucrose, and/or starch. The title product has stable structure, good thermal stability, and good recycling properties.

AB To enhance the kinetics of poorly conducting cathode materials for Li batteries, the authors have proposed a number of strategies based on crushing the active material into nanopowder and embedding the powder into a carbon-based web or coating. Using the well-elaborated example of LiFePO4, we demonstrate that the same goal can be achieved with a different approach where the active material remains in a form of large (1-20 μm) single crystals. Instead of crushing the material, we make it porous, with average pore size around 50 nm and pore surface area of 25 m2/g. The walls of the pores (but also the outer surfaces of crystals) are covered with ca. 1 nm thick carbon film. Most surprisingly, such a unique nanoarchitecture can be prepared using a simple sol-gel based procedure including a single heat treatment. The crucial part is the selection of appropriate carbon precursor. For example, citric acid decomps. quite vigorously into gases and solid carbon at temps. up to ca. 450 °C. This range matches exactly the first solidification of LiFePO4. Thus, the evolving gases can create an interconnected web of pores while the solid parts (carbon) are deposited simultaneously on the walls of pores. We further show that a carbon content of less than 3% is already sufficient for surpassing the percolation threshold with respect to surface conductivity of carbon. Using more carbon can decrease the rate performance so a fine balance is required in this respect. Most importantly, carbonization at a temperature of slightly less than 700 °C is sufficient to achieve a composite conductivity of the order of 10-2 S cm-2-more than sufficient for good cathode kinetics. In the end, we show new evidence that the phase that is responsible for high conductivity of LiFePO4-C composites is indeed the carbon phase.

AB A series of LiFePO4/C materials were prepared by a reformative solid-coordination method which uses citric acid as the coordination agent and C source. A monodentate coordination bond of -COO-M forms gradually and that helps to disperse Li+ or Fe2+ in the homogeneous gel during grinding. Impure phase Fe2P was detected in the LiFePO4/C composites with increasing annealing temperature The remnant coating C was considered to be the reductive in pure N. The amts. of C, particle size and morphol. were studied in detail and all the results can be related to the formation of Fe2P. The electro-conductive Fe2P phase in LiFePO4/C composites has an important role in increasing electronic conductivity and it improves the electrochem. performance of LiFePO4/C including the polarization phenomenon, comparatively high reversible capability, stable cycling performance and slight trend of less loss of rate capability.

CC 52-2 (Electrochemical, Radiational, and Thermal Energy Technology)
AB Lithium iron phosphate coated with carbon (LiFePO4/C) was synthesized by a rheol. phase reaction using a comparatively lower temperature and less sintering time. The carbon came from citric acid, which acted as a new carbon

source. It was characterized by thermogravimetry and DTA (TG/DTA), X ray diffractometer (XRD), Element Anal. (EA) and Scanning electron microscope (SEM). We also studied the electrochem. properties of the material. The first discharge capacity of the LiFePO4/C is 121 mAh · g-1 at 10 mA · g-1 at room temperature When the c.d. increased to 100 mA · g-1 · the first discharge capacity decreased to 110 mAh · g-1 and retained 95% of the initial capacity after 100 cycles. The LiFePO4/C obtained shows a good electrochem. capacity and cycle ability at a large c.d.

AB Electrode-active materials, especially for alkali ion insertion (i.e., Na+ and Li+) for lithium batteries, contain, as an active component, a composition of general formula AaDdMmZsOoNnFf,, in which: (1) A is an alkali metal, (2) D is an alkaline earth metal or a Group IIIA element, with the exception of B, (3) M is a transition metal, (4) Z is a non-metal selected from S, Se, P, As, Si, Ge, Sn, and B, (5) O is oxygen, N is nitrogen, and F is fluorine, and (6) a, d, m, z, o, n, and f are ≥0. The compns., which also contain an electron conductor, such as carbon, are prepared by thermal decomposition of homogeneously mixed precursors, which are organic or organometallic derivs. (preferably at 200-600°). Preferred

components include: (1) A = Li, Na, and K, (2) D is Mg, Al, and Ga, (3) M = Fe, Ni, Co, Mn, V, Mo, Nb, W, and Ti; preferred components are $LiFePO_4$, $LiFeBO_3$, or $NaFeBO_3$.

AB LiFePO4-C composite cathode material for lithium batteries was

prepared The active component consists of micrometer-sized particles having pores with a large size distribution. When filled with electrolyte, the pores are responsible for supply of ions while the distance between the pores (30-150 nm) dets. the solid-state diffusion kinetics. The walls of pores are covered with a C layer which serves as an electron conductor and is thin enough (2-3 nm) to allow penetration of Li ions. The synthesis is sol-gel based with a single heating step. The electrochem. performance is the best known for LiFePO4 cathodes.

AB The authors describe the thermodn. and kinetics that govern the precipitation of pure powders of phosphates phases of interest for Li-battery applications. The authors found precise procedures for the formation of three distinct crystalline forms of FePO4·2H2O and of pure LiMnPO4. The attempts to precipitate either LiCoPO4 or LiFePO4, however, failed. In this latter case, optimized electrodes for battery applications were synthesized through a chemical conductive carbon coating at the surface of LiFePO4 prepared by evaporation of an FeIII-containing aqueous solution

AB LiFePO4/carbon composite cathode materials were synthesized by a sol-gel process. The citric acid in the developed sol-gel process plays the role not only as a complexing agent but also as a carbon source, which improves the conductivity of the composites and hinders the growth of LiFePO4 particles. Nanosized LiFePO4 particles without the impurity phase were successfully synthesized. The grain size of LiFePO4 particles in the range of 20-30 nm is obtained at calcining temps. 450-850°. Increasing the calcination temperature leads to a decrease in the carbon content but an increase in the conductivity of the composites in the range of 400-850°. However, the conductivity slightly decreases if the calcination temperature further increases to 950°. The LiFePO4/carbon composite synthesized at 850° shows the highest conductivity (10-3 S/cm), the highest sp. capacity, and the best rate capability among the synthesized materials. It is worthy to note that the cell performance of the LiFePO4 depends on the electrochem. cycling procedure employed.

AB The invention provides a new route for the synthesis of carbon-coated powders having the olivine or NASICON structure, which form promising classes of active products for the manufacture of rechargeable lithium batteries. Carbon-coating of the powder particles is necessary to achieve good performances because of the rather poor electronic conductivity of the structures. For the preparation of coated LiFePO4, sources of Li, Fe and phosphate are dissolved in an aqueous solution together with a polycarboxylic acid and a polyhydric alc. Upon water evaporation, polyesterification occurs while a mixed precipitate is formed containing Li, Fe and phosphate. The resin-encapsulated mixture is then heat treated at 700° in a reducing atmospheric This results in the production of a fine powder consisting of an olivine
LiFePO4 phase, coated with conductive carbon. When this powder is used as active material in a lithium insertion-type electrode, fast charge and discharge rates are obtained at room temperature and an excellent capacity retention is observed

AB The invention relates to materials for use as electrodes in an alkali-ion secondary battery, particularly a lithium-ion battery. The invention provides transition-metal compds. having the ordered-olivine, a modified olivine, or the rhombohedral NASICON structure and the polyanion (PO4)3- as at least one constituent for use as electrode material for alkali-ion rechargeable batteries.

AB The lithium ion cell is improved appreciably in operational stability under special conditions, such as high temps., and exhibits superior characteristics against over-discharging, while guaranteeing compatibility to the operating voltage of a conventional lithium ion cell and an energy d. equivalent to that of the conventional lithium ion cell. To this end, the lithium ion cell includes a pos. electrode, a neg. electrode and a nonaq. electrolyte, and uses, as a pos. electrode active material, a composite material of a first lithium compound represented by the general formula LixMyPO4, where 0 <x< 2, 0.8 <y< 1.2 and M contains Fe, and a second lithium compound having a potential holder than the potential of the first lithium compound

ST lithium nonaq electrolyte cathode

IT Charcoal
RL: DEV (Device component use); USES (Uses)
(activated; cathode for nonaq. electrolyte lithium ion battery)

IT Battery cathodes
(cathode for nonaq. electrolyte lithium ion battery)

IT Carbon fibers, uses
Carbonaceous materials (technological products)
Coke
Petroleum coke
RL: DEV (Device component use); USES (Uses)
(cathode for nonaq. electrolyte lithium ion battery)

IT Carbon black, uses
RL: MOA (Modifier or additive use); USES (Uses)
(cathode for nonaq. electrolyte lithium ion battery)

IT Fluoropolymers, uses
RL: TEM (Technical or engineered material use); USES (Uses)
(cathode for nonaq. electrolyte lithium ion battery)

IT Organic compounds, uses
RL: DEV (Device component use); USES (Uses)
(high mol., sintered; cathode for nonaq. electrolyte lithium ion battery)

IT Secondary batteries
(lithium; cathode for nonaq. electrolyte lithium ion battery)

IT Coke
RL: DEV (Device component use); USES (Uses)
(needle; cathode for nonaq. electrolyte lithium ion battery)

IT Coke
RL: DEV (Device component use); USES (Uses)
(pitch; cathode for nonaq. electrolyte lithium ion battery)

IT Furan resins
Phenolic resins, uses
RL: DEV (Device component use); USES (Uses)
(sintered and carbonized; cathode for nonaq. electrolyte lithium ion battery)

IT 50-21-5D, Lactic acid, ester 60-29-7, Diethyl ether, uses 64-19-7D, Acetic acid, ester, uses 75-05-8, Acetonitrile, uses 79-09-4D, Propionic acid, ester 96-47-9, 2-Methyltetrahydrofuran 96-48-0 96-49-1, Ethylene carbonate 100-66-3, Anisole, uses 105-58-8, Diethyl carbonate 107-12-0, Propionitrile 108-32-7, Propylene carbonate 109-99-9, Thf, uses 110-71-4, 1,2-Dimethoxyethane 126-33-0, Sulfolane 409-21-2, Silicon carbide sic, uses 554-12-1, Methyl propionate 616-38-6, Dimethyl carbonate 623-42-7, Methyl butyrate 623-96-1, Dipropyl carbonate 629-14-1, 1,2-Diethoxyethane 646-06-0, 1,3-Dioxolane 872-36-6, Vinylene carbonate 1072-47-5, 4-Methyl-1,3-dioxolane 1313-08-2 2550-62-1, Lithium methanesulfonate 4437-85-8, Butylene carbonate 7439-93-2, Lithium, uses 7440-50-8, Copper, uses 7447-41-8, Lithium chloride, uses 7550-35-8, Lithium bromide 7782-42-5, Graphite, uses 7791-03-9, Lithium perchlorate 9003-07-0, Polypropylene 12007-81-7, Silicon tetraboride 12008-29-6,

Silicon hexaboride 12013-56-8, Calcium disilicide 12017-12-8, Cobalt disilicide 12018-09-6, Chromium disilicide 12022-99-0, Iron disilicide 12032-86-9, Manganese disilicide 12033-76-0, Silicon nitride oxide Si2N2O 12033-89-5, Silicon nitride, uses 12034-80-9, Niobium disilicide 12039-79-1, Tantalum disilicide 12039-83-7, Titanium silicide TiSi2 12039-87-1, Vanadium disilicide 12039-88-2, Tungsten disilicide 12059-14-2, Nickel silicide (Ni2Si) 12136-78-6, Molybdenum disilicide 12159-07-8, Copper silicide cu5si 12190-79-3, Cobalt lithium oxide colio2 12201-89-7, Nickel disilicide 14283-07-9, Lithium tetrafluoroborate 14485-20-2, Lithium tetraphenylborate 15365-14-7, Iron lithium phosphate FeLiPO4 19414-36-9, Iron lithium manganese phosphate ((Fe,Mn)Li(PO4)) 21324-40-3, Lithium hexafluorophosphate 22831-39-6, Magnesium silicide (Mg2Si) 29935-35-1, Lithium hexafluoroarsenate 33454-82-9, Lithium trifluoromethanesulfonate 35678-71-8, Methylsulfolane 90076-65-6 113066-89-0, Cobalt lithium nickel oxide Co0.2LiNi0.8O2 113671-38-8, Silicon oxide SiO0-2 160479-36-7, Lithium tin oxide 178958-56-0, Lithium silicon oxide 300858-61-1 339333-78-7, Zinc silicide ZnSi2 371148-86-6, Tin oxide (SnO0-2) 371148-87-7, Lithium magnesium manganese oxide (LiMg0.2Mn0.8O2)
RL: DEV (Device component use); USES (Uses)
(cathode for nonaq. electrolyte lithium ion battery)

IT 24937-79-9, Pvdf
RL: TEM (Technical or engineered material use); USES (Uses)
(cathode for nonaq. electrolyte lithium ion battery)

IT 7440-44-0, Carbon, uses
RL: DEV (Device component use); USES (Uses)
(pyrocarbon; cathode for nonaq. electrolyte lithium ion battery)
